
What are you trying to ship?

Product build · Internal tool · AI agent · Data pipeline · Automation & integration · Prototype rescue

syncing Shopify orders into Zoho without duplicates →

A few questions, then you get effort in weeks.

This goes straight into your spec. If you send it to us, we keep the brief and your contact details so we can reply — nothing else, and never passed on.

`14 builds shipped · 6 build types scoped · discovery spikes open this quarter`

WHERE BUILDS DIE

The first 80% is nearly free now.
The last 20% is the part that pages you.

Tokens expire	and nobody finds out until a customer does.
A webhook drops	and the order is simply never created.
A retry fires twice	and now there are two of everything.
Traffic triples	and the bill triples with it, quietly.
Something breaks at 2am	and no one is watching the logs.

None of it shows in a demo. All of it shows in production.

WHAT WE BUILD

Most of it starts from an empty repo.

New builds are the main thing we do — a product, an internal tool, an agent that does real work. Integration is one branch, not the category.

Product build	A new product or customer-facing app
Internal tool	Something your own team runs on
AI agent	A model doing real work, not a demo
Data pipeline	Moving and shaping data on a schedule
Automation & integration	Two systems that should be one workflow
Prototype rescue	Something exists and it isn't production-ready

ADVISORY

Not sure where AI belongs in your business? That is a conversation, not a build.

We look at how the work actually runs today and tell you where a model earns its keep — and where it would just add a way to be wrong. You get that answer whether or not you hire us to build anything.

What to automate

The steps that are repetitive, high volume, and cheap to check.

What to leave alone

Anything where being confidently wrong costs more than being slow.

What it costs to run

Not the build — the monthly bill once real volume goes through it.

WORK

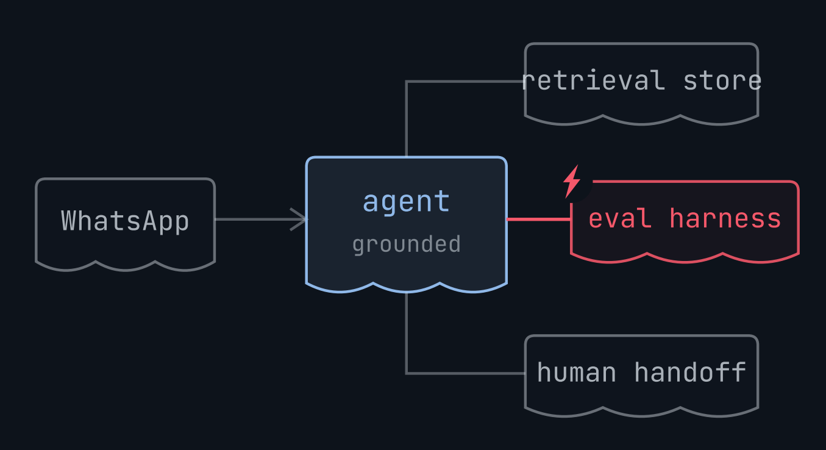
Real builds, ugly parts included.

See all four →

AI AGENT · 7 WEEKS

A WhatsApp agent that survives real volume

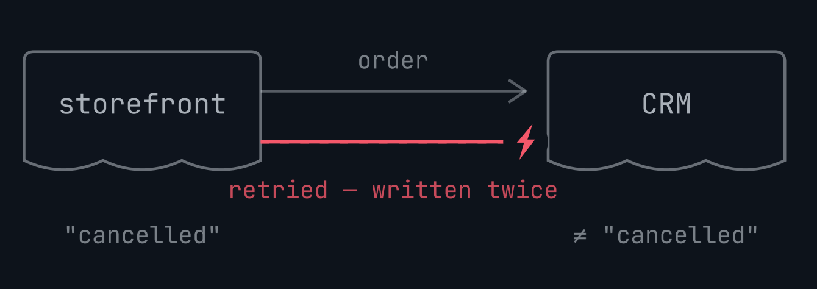
> The eval harness took longer than the agent itself — and is the only reason it didn't regress silently after the third prompt change.



INTEGRATION · 4 WEEKS

Order sync between a storefront and a CRM that disagreed on "cancelled"

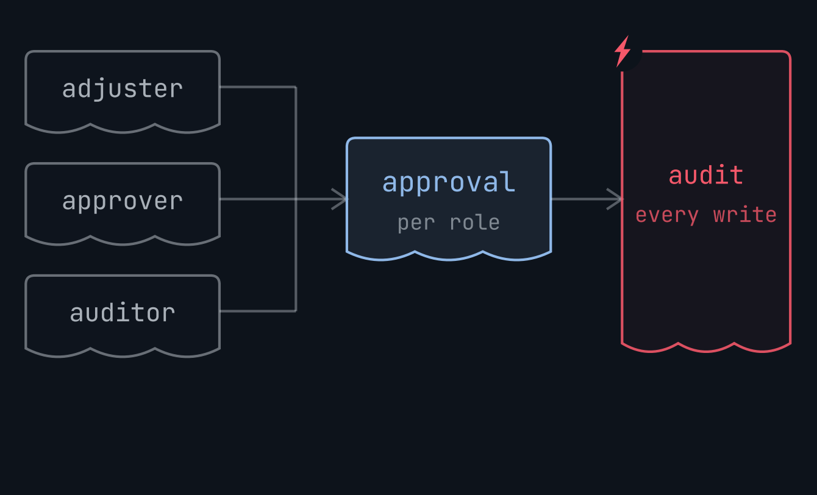
> Idempotency keys were missing on both ends. Fixing it meant a migration pass over three months of historical orders before the sync could go live.



PRODUCT BUILD · 9 WEEKS

An internal claims tool for a small insurer

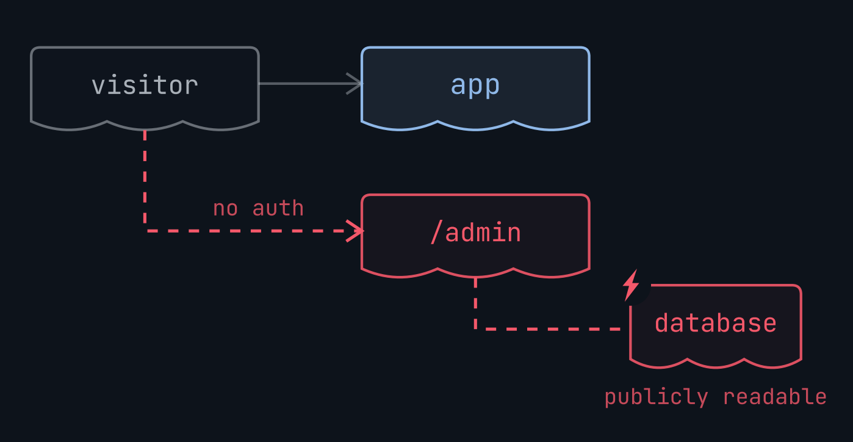
> The permission model was the real product. The screens were the easy 20%.



PROTOTYPE RESCUE · 3 WEEKS

A Bolt-built booking app with no auth

> The database had been publicly readable for six weeks before anyone noticed. We rotated every credential on day one.



RESCUE

Production-readiness triage for something that already exists — and isn't ready yet.

See the checklist →

ABOUT

Who builds this, what handover looks like, and what we don't take on.
