WORK

Real builds. Ugly parts included.

Four, spanning the range on purpose — a product, an agent, an integration, a rescue. Depth beats breadth; twelve thin case studies would say less than these four.

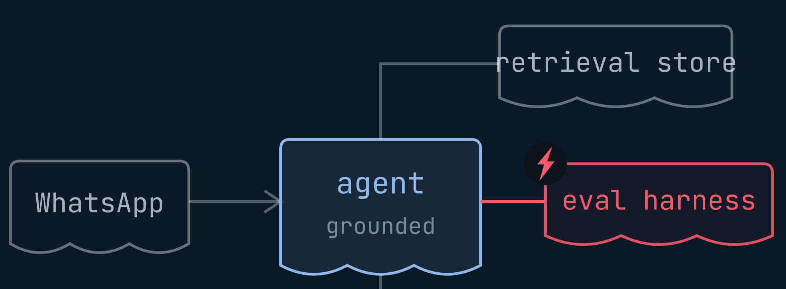
AI AGENT

7 weeks

A WhatsApp agent that survives real volume

A support bot for a regional retailer that had already burned one build on prompt-only logic. We replaced it with grounded retrieval, an eval harness and a human handoff path for anything the model shouldn't touch.

The ugly part: The eval harness took longer than the agent itself — and is the only reason it didn't regress silently after the third prompt change.



How it fits together — the part in red is the part that hurt.

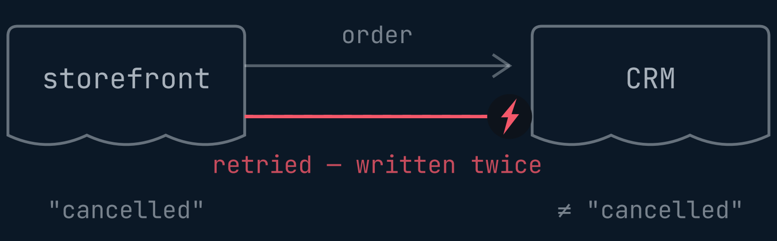
INTEGRATION

4 weeks

Order sync between a storefront and a CRM that disagreed on "cancelled"

Two systems that were supposed to be one workflow. Orders were duplicating on retries and refunds weren't reconciling.

The ugly part: Idempotency keys were missing on both ends. Fixing it meant a migration pass over three months of historical orders before the sync could go live.



How it fits together — the part in red is the part that hurt.

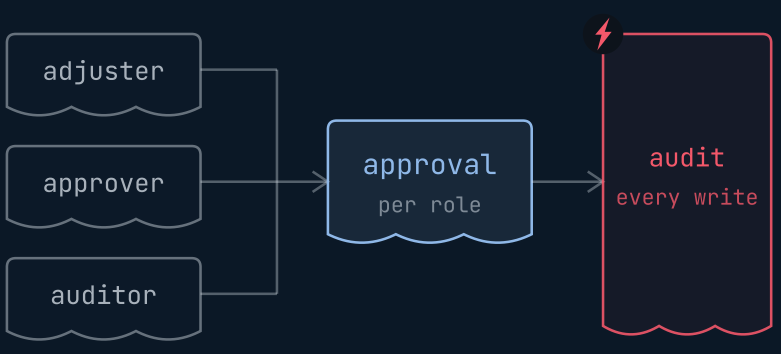
PRODUCT BUILD

9 weeks

An internal claims tool for a small insurer

Three roles, a real approval workflow, and an audit trail required by a regulator who does actually read the logs.

The ugly part: The permission model was the real product. The screens were the easy 20%.



How it fits together — the part in red is the part that hurt.

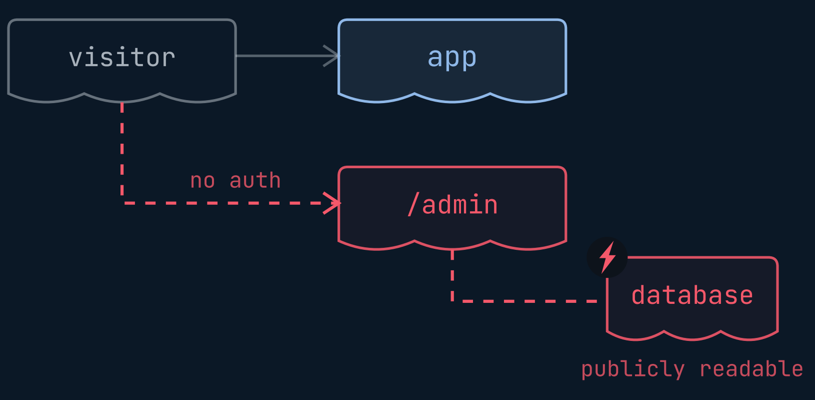
PROTOTYPE RESCUE

3 weeks

A Bolt-built booking app with no auth

Worked perfectly in the demo. In production it had no rate limiting, no error states, and an admin route anyone could hit unauthenticated.

The ugly part: The database had been publicly readable for six weeks before anyone noticed. We rotated every credential on day one.



How it fits together — the part in red is the part that hurt.
